R
γ
t
γ
Hint: e^x *is called by the numpy function np.exp().*

t_x
t_0
x
v
t_0
Hint: mean $= \bar{x} = \frac{x_1+x_2+...+x_n}{n}$
An even bigger hint: think about the axis you want to use numpy.mean() along

correction
Hint: we want to remove the dip. Remove kind of sounds like we want to subtract something
Hint:$\Delta v = \Delta x/\Delta t$
Extra marks: perform the trace mixing pre-stack. What are the pros and cons of a pre-stack trace mix?
